

## Manual Fieldwork Online

<http://fieldworkonline.geo.uu.nl/>

A digital and up-to-date version of this manual is online at:

<http://fieldworkonline.geo.uu.nl/manual/>

Questions? Send an e-mail to [k.alberti@uu.nl](mailto:k.alberti@uu.nl) or visit ZON102.

The Fieldwork Online web application is used during fieldwork practicals to help students and their supervisors to:

- Access and investigate existing datasets about the study area
- Share and archive data collected in the field
- Communicate, ask questions, and provide georeferenced feedback

### Notes on being a supervisor

Supervisors have special privileges in the Fieldwork Online application. Their home view (after logging in) consists of a project overview where all the workspaces of enrolled students, as well as other supervisors, can be viewed (Figure 1). It is also possible for supervisors to enrol students manually. Students can create an account and enroll themselves in a fieldwork practical with an invitation code, without any intervention from staff. All that is required is to provide students with the invitation code found on the home screen of the relevant fieldwork project.

The screenshot shows the 'Fieldwork Online' web application in a Mozilla Firefox browser. The page title is 'Frankrijk 2015' with the subtitle 'Fysische Geografie Veldwerk Frankrijk 2015'. The user is logged in as 'koko'. The page is divided into two main sections: 'Enrolled students' and 'Supervisors and administrators'. The 'Enrolled students' section lists two students: 'derekStudent' and 'student'. The 'Supervisors and administrators' section lists seven supervisors: 'admin', 'koko', 'woutermarra', 'martin', 'janrik', and 'eveline'. Each supervisor entry includes their username, email, last data upload time, and a 'View workspace' button. Red boxes highlight the 'Enrolled students' and 'Supervisors and administrators' sections, with corresponding labels on the right.

Username	E-mail	Details	Action
derekStudent	d.karssenber@gmail.com	Last data upload: 2 hours ago	View workspace
student	k.alberti@students.uu.nl	Last data upload: No data uploaded yet	View workspace

Username	E-mail	Details	Action
admin	kokoalberti@yahoo.com	Last data upload: 17 March at 18:25	View workspace
koko	kokoalberti@fastmail.nl	Last data upload: 5 minutes ago	View workspace
woutermarra	w.a.marra@uu.nl	Last data upload: 24 March at 15:02	View workspace
martin	M.R.Hendriks@uu.nl	Last data upload: No data uploaded yet	View workspace
janrik	J.H.vandenBerg@uu.nl	Last data upload: No data uploaded yet	View workspace
eveline	E.C.vanderDeil@uu.nl	Last data upload: No data uploaded yet	View workspace

## Workspaces

Once a student or supervisor has been enrolled in a fieldwork project, a personal workspace will be made available to them. This consists of a web map with background layers related to the project, some base layers which show the fieldwork area, and pages which let you add data and leave comments or feedback on locations in the map. When a student logs in they will be shown their workspace (Figure 2). Supervisors can view individual student's workspaces by clicking the “View workspaces” link on their home view (Figure 2).

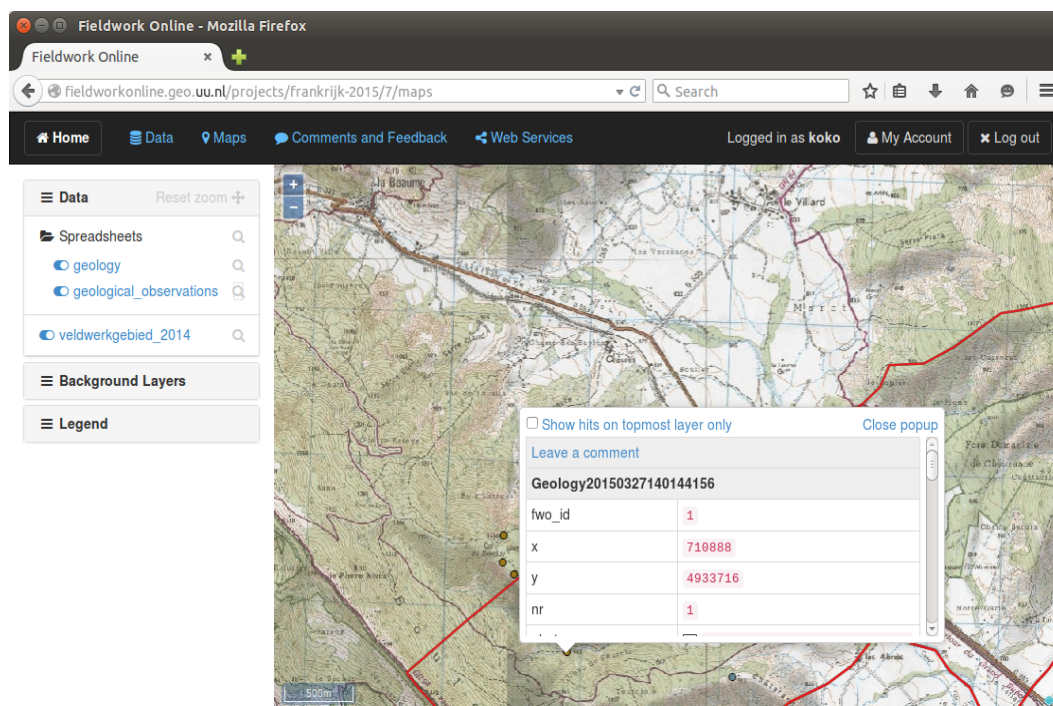

Figure 2. A users' workspace

The side menu in the map view shows uploaded data points in the “Spreadsheets” folder, and the map can be clicked to query features at that location or to leave a comment. Comments can be posted by clicking the **Leave a comment** link in the popup.

### Adding point data using a spreadsheet (Data Menu)

Users can only upload data to their own workspaces on the page under the **Data** menu. To simplify this process and to allow maximum flexibility, data is uploaded as a spreadsheet in Excel (xls orxlsx) format. Defining the structure and type of data to collect is arbitrary and up to whoever collects the data, as long as some simple but important guidelines are followed:

1. The first row is reserved for attribute headers, or the properties of your data. Attributes can be things like “color”, “size”, “description”, or “photo” if you intend to add a photograph taken at that location. You are free to choose your own names or even add columns which have been derived or calculated from other fields.
2. You must use one column for the x-coordinate and one column for the y-coordinate. Make sure that these columns can be recognised by using a header like “x” and “y” or “lat” and “lng”.
3. The name of the sheet defines the name of the data layer. Make sure to give it a clear and concise name (so not “Sheet1”). In this way, you can use multiple sheets in your Excel document and upload them all at once.

An example of a spreadsheet that you could upload to your workspace is shown in Figure 3. There is some more advanced functionality available as well. For example, if your points are recorded in a projected coordinate system, you must specify the EPSG code of the coordinate system in brackets after your header name, otherwise the system will not know where on the Earth your points are located. Adding filenames is also an option, such as the “Sketch” and “Photo” attributes of the spreadsheet in Figure 3. If you do so, make sure to upload the actual files as well so they can be viewed directly in the map.

### Adding photos and other files or documents (Data Menu)

Besides spreadsheets with point data, other types of documents such as photos or PDFs can also be uploaded on the Data page. They will be stored and available under the “Overview of uploaded files.” Any filenames which have been entered in the spreadsheets will link to these files, so if you've added a reference to a photo in your spreadsheet, make sure to upload the photo's file under the **Data** menu as well.

### Viewing background information (Maps Menu)

On the maps page the “Background Layers” in the sidebar allow users to view different data layers as a background. The backgrounds, such as a topographic map, aerial photographs, or satellite imagery, is configured on a per-project basis by the fieldwork online administrators.

### Leaving comments and feedback (Maps)

The Fieldwork Online website can be used for communication between students and supervisors. Comments, feedback and questions with an explicit spatial component can be asked via the map interface. This functionality is not intended to replace e-mail or other types of communication between a specific student and supervisors, but rather to make it easier to record and discuss issues related to locations. A comment can be added by clicking somewhere on the map. In the popup menu which opens select **Leave a comment** (See Figure 2), and a snapshot of the map as you've selected it will be stored alongside your comment as shown in Figure 4.

Students who have questions about a specific location or point may find this useful, as well as supervisors who wish to make a suggestion or direct their students to a particular location. An

overview of the feedback and comments can be viewed under the **Feedback and Comments** menu (Figure 5). It is also possible to post responses here to questions, or for students to reply to feedback by supervisors.

## Accessing the data in a desktop GIS (Web Services Menu)

The data points which have been uploaded into a user's workspace can also be viewed in a desktop GIS system such as QGIS or ArcGIS. A GIS program allow you to work locally on the data and offer more options for spatial analysis and data visualization. On the **Web Services** menu is a link for the WMS (Web Map Services) and WFS (Web Feature Services) of the data in the workspace. WFS serves data as vector features whereas WMS serves data as a ready made and colored map. Because vector features allow for better querying and visualization of the data, it is advisable to use WFS to access data in the workspace.

To add the data to a project in QGIS Desktop, use the **Layer > Add Layer > Add WFS Layer** menu. Click **New** to create a new WFS connection and enter the URL found on the web services page as in Figure 6.

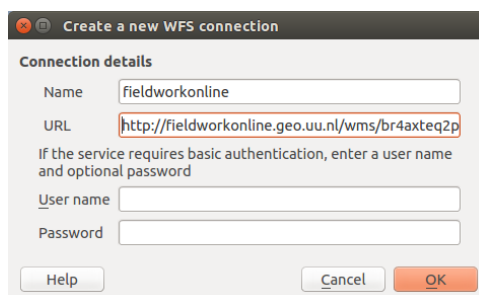

Figure 6. Creating a new WFS connection in QGIS

Click **OK** and then **Connect** to view the available layers. Select a layer and click **Add** to add them to your project (Figure 7).

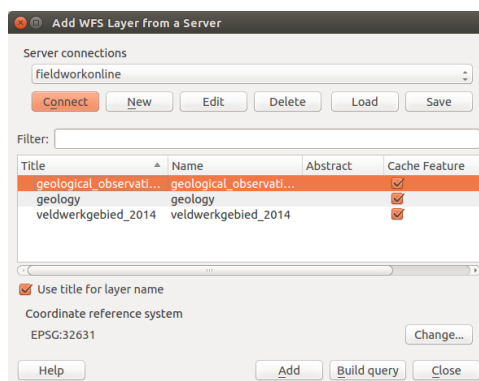

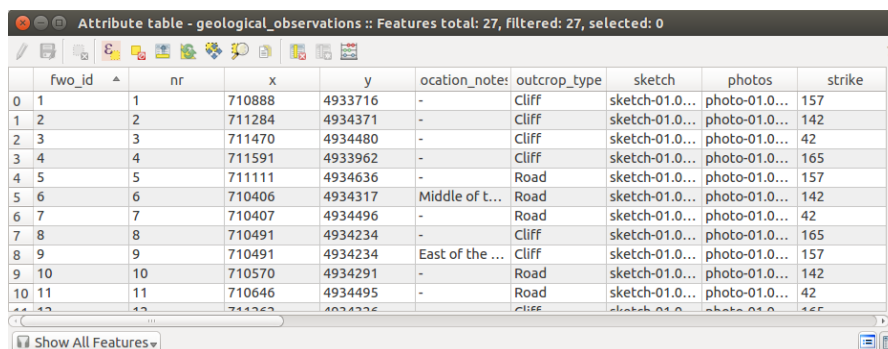

Figure 7. Listing the layers of a WFS connection and loading the data in QGIS

The feature data includes all the attributes values that have been created in the spreadsheet, as can be seen in the WFS attribute table (Figure 8).

Further styling can be done in the same way as if you loaded all the vector data directly from a shapefile (Figure 8).

## Feedback

The Fieldwork Online application is still under development. If you run into bugs, missing features, or something which you think could work better in another way, please let us know! We hope that an iterative process based on feedback of supervisors and students alike will help to improve the application more than we could do on our own.
